### EDUCATION

The Ohio State University: Columbus, OH  
B.S. Computer Science & Engineering

May 2026

### TECHNICAL SKILLS

- **Languages:** Java, Python, C++, C, JavaScript, Kotlin, HTML5, CSS3
  - **Frameworks/Libraries:** React.js, Node.js, Express.js, Spring Boot, MapLibre
  - **Databases:** PostgreSQL, PostGIS, MySQL
  - **Tools/Systems:** Git, Docker, Linux/Unix, REST APIs, Bash, x86 Assembly
  - **Testing:** JUnit, Jest, GDB, Valgrind
- 

### INTERNSHIP EXPERIENCE

**Software Engineering Intern** — Ubihere (AI & Tech Startup)– Hilliard, OH *May-December 2025*

- Cut routing latency by 95%+, from ~100ms to ~7ms, by deploying a Dockerized OSRM routing engine with PostgreSQL for real-time fleet tracking.
- Scaled routing infrastructure across 1.4B+ nodes and 143M+ road segments, enabling nationwide navigation.
- Built a Snap-to-Road API using PostgreSQL/PostGIS to process 1.8M+ Ohio roads, generate confidence scores, and expose routing data through REST endpoints.
- Developed React and MapLibre frontends with dual-map layouts, offline tiles, and live monitoring tools for fleet operations.
- Led an all-intern team to a Hack Day win by building a Google-integrated CRM prototype within 24 hours.

**Software Engineering Intern** — Southwestern Ambulance Services LLC – Columbus, OH *May-August 2024*

- Engineered a full-stack scheduling platform (Java backend + JS frontend), reducing scheduling time by 30%.
  - Implemented secure authentication and RBAC for dispatch operations, strengthening system integrity.
  - Optimized JSON-based data handling, improving backend response times by 35%.
  - Built JUnit and Jest test coverage for backend and frontend logic, improving reliability across workflows.
- 

### PROJECT EXPERIENCE

**SystemsLens** — Architecture Impact Simulation Platform — Personal Project *March 2026–June 2026*

- Built and deployed a full-stack system design simulator using React, TypeScript, Spring Boot, Java, and PostgreSQL to model distributed architectures as directed dependency graphs.
- Developed graph traversal engines for outage, schema-change, and traffic-spike simulations, identifying direct/indirect impact, failure paths, severity levels, and downstream risk.
- Created an interactive React Flow dashboard that highlights failed services, impacted dependencies, and propagation chains across APIs, databases, queues, workers, and external providers.

**FitCheck** — Weather-Based Outfit Recommendation App — Academic Project *January-April 2026*

- Built an Android app that recommends outfits based on real-time weather data, user comfort preferences, and daily feedback logs.
  - Implemented MVVM architecture with ViewModel/LiveData and Room Database to persist comfort history, notes, temperatures, and suggestions.
  - Added user preference tracking, settings reset, API-based weather retrieval, and unit/UI testing for reliability.
- 

### LEADERSHIP AND PROFESSIONAL INVOLVEMENT

**Girls Who Code (GWC)** — The Ohio State University - Columbus, OH

*Member, 2024 – May 2026*

- Mentored junior developers in Java and C and supported workshops on data structures, debugging, and programming fundamentals.
